

Bridge / PIMASCOR handoff guide

Client handoff edition

A clear, controlled reference for Bridge and PIMASCOR operations, acceptance, and ownership decisions.

Prepared for	Bridge / PIMASCOR
Edition	2026-08-01
Source	HANDOFF-BRIDGE-PIMASCOR.md
Status	Client-facing; infrastructure and source code excluded

Brand reference: bridge-ph.com/about-us/

Bridge / PIMASCOR operational handoff

This document defines the handoff of the hosted PIMASCOR production service to Bridge. It is an operational handoff, not a transfer of secrets through email or chat. It assumes the application remains hosted on the existing Fedora CoreOS VPS and that Bridge is the client and operational owner after acceptance.

1. Handoff boundary

The day-to-day service is already deployed at:

The production runtime facts are:

Area	Location or service
Production data, PostgreSQL data, uploads, backup staging	~/bridge-ph/pimascor on the VPS
Rootless service definitions	~/.config/containers/systemd/bridge-ph/pimascor
Shared edge proxy	Rootless Caddy user service
Public route	delegateops.business/pimascor/
Object storage	Private Backblaze B2 bucket and production prefix configured in the VPS secrets
Transactional email	Resend account configured in the VPS secrets
Encrypted backups	Restic repository configured in the VPS secrets and backup timers

Routine users do not need the source tree, Python, Node.js, npm, PostgreSQL, Restic, AWS CLI, or B2 CLI on their computers. They use the HTTPS application. Authorized operators use the restricted technical runbook for host maintenance.

2. Files for the client handoff

Send Bridge a read-only PDF or archive containing these documents and reference files. Confirm that the version/commit is recorded on the handoff cover sheet.

Required

- docs/PRODUCT-SPEC.md - product scope and supported capabilities.
- docs/REQUIREMENTS-V2.md - approved requirements and business rules.
- docs/USER-FLOWS.md - role-based workflows for acceptance testing.
- docs/API-CONTRACT.md - supported API behavior for integrations and support.
- docs/DATA-EXPORTS.md - archive contents, retention, and export controls.
- docs/INCIDENT-REPORTING.md - user reporting and operator response behavior.
- docs/QUALITY-ASSURANCE.md - release and browser/device acceptance criteria.
- docs/UX-PHILIPPINE-CONTROLS.md - language, currency, and PH-context controls.
- docs/reference/AAA_FORMAT_QUOTATION_revised.pdf - quotation/contract layout

reference used for dynamic print output.

The client packet intentionally excludes Podman Quadlets, Caddyfiles, Bash scripts, deployment scripts, and source code. Those are operator/developer materials, not user-facing handoff documents. The restricted technical runbook, docs/PRODUCTION-VPS-DEPLOYMENT.md, remains with the VPS operator and can be disclosed later under an

agreed support scope.

The demo runbook and demo Quadlets are not production operating instructions and must not be included in this client packet.

3. Access and ownership transfer

Transfer access through the provider's invitation or an approved password manager. Never place values in the handoff archive.

Transfer or document the owner and backup owner for:

1. VPS account and rootless service account j k (or a newly created Bridge operator account).
1. DNS and domain registrar for de l e g a t e o p s . b u s i n e s s .
1. CDN account and purge controls, if a CDN is used in front of the VPS.
1. Backblaze B2 account, private bucket, application keys, and lifecycle rules.
1. Resend account, sending domain, API key, and verified sender identity.
1. GitHub private repository and organization/team access, if the source/IP

transfer is included in the contract.

1. Password manager vault containing production secrets and the Restic password.

Create named Bridge accounts where supported. Do not hand over a shared personal login. Require MFA, least privilege, and an emergency recovery owner.

4. Never send in the ordinary handoff archive

Do not email, paste, or commit any of the following:

database passwords, or session/CSRF secrets.

- VPS SSH private keys, GitHub tokens, CDN tokens, DNS tokens, or password-reset links.

- A plaintext .env file or shell history containing credentials.
- A production PostgreSQL dump, upload archive, or Restic repository unless

Bridge explicitly requests it and the transfer is encrypted, access-limited, logged, and covered by the data-processing agreement.

- OTP codes, user passwords, browser cookies, or active session exports.

Production attachments and accounting records may contain personal or sensitive information. Treat any data copy as a controlled disclosure, not as a software artifact.

5. Acceptance session with Bridge

Record evidence for each item below, including date, operator, build commit, and the account used. Do not record passwords or full document contents.

- HTTPS route and API health endpoint respond successfully.
- Admin can see and manage the documented accounts, including Mich.
- First-login email OTP and password activation work for a test account.
- GM and DCS payment authority/override rules match the approved policy.

- Quotation print preview and generated PDF dynamically populate client, shipment, currency, amount, terms, and dates using the revised reference.
- Authorized users can open quotation and uploaded document attachments; unauthorized users receive the expected denial.
- CSV accounting export and full archive export produce the documented formats.
- Export retention, one-hour download availability, and weekly request limit are confirmed with non-production test data.
- PostgreSQL dump, Restic backup, and a restoration test are evidenced.
- Resend operational and technical incident notifications reach the agreed recipients without exposing confidential payloads.
- Desktop and mobile acceptance is completed in Chromium, WebKit, and Gecko.

Acceptance is incomplete until Bridge signs the operational checklist and names the person responsible for incident response and backup restoration.

6. First 24 hours after acceptance

Bridge should:

1. Confirm the owner and backup operator can log in through separate accounts.
1. Rotate any credential that was temporarily shared during commissioning.
1. Verify the VPS firewall, DNS, TLS renewal, Caddy service, and rootless user lingering are still enabled.
1. Run one controlled backup and verify that the Restic repository can list and restore a test object.
1. Confirm the production B2 bucket is private and the production prefix is separate from demo objects.
1. Confirm the data-retention, incident-response, and data-subject request contacts under Bridge/PIMASCOR's privacy governance.

After the agreed support window, revoke the developer's SSH, cloud, email, CDN, DNS, and repository access unless a written support agreement requires it.

7. Governance basis

This handoff uses a least-privilege, evidence-based transfer model. CIS Controls v8.1 recommends prioritizing foundational safeguards through Implementation Group 1 and measuring them; NIST SP 800-61 Rev. 3 treats incident response as part of the wider CSF 2.0 risk-management lifecycle. For Philippine operations, the National Privacy Commission's Data Privacy Act guidance requires reasonable and appropriate organizational, physical, and technical safeguards and requires third-party processors to implement appropriate protections.

These references guide the operational checklist; they do not replace Bridge's contract, data-processing agreement, privacy notices, retention policy, or legal review.

8. Source and intellectual-property transfer

The initial client handoff does not include source code. The hosted service can be used without a local source checkout, compiler, or build environment. If PIMASCOR or Bridge later wants the complete source/IP package, it

requires a separate purchase and written transfer agreement with you; it is not included automatically in this operational handoff.

If that separate source/IP purchase is approved, perform a recorded transfer:

- grant Bridge access to the private GitHub repository or deliver an encrypted repository archive;
- include the exact release commit accepted in Section 5;
- include the complete source, migrations, tests, infrastructure definitions, reference PDFs, and build metadata required by the contract;
- transfer repository ownership or establish the agreed maintainer model;
- rotate deploy keys, CI tokens, signing keys, and personal access tokens after the transfer;
- keep the operational handoff free of production secrets and live personal data.

Ownership, license, warranty, support period, and liability terms should be confirmed in writing by the parties; this document is not legal advice.
