

Role-based user flows

Client handoff edition

A clear, controlled reference for Bridge and PIMASCOR operations, acceptance, and ownership decisions.

Prepared for	Bridge / PIMASCOR
Edition	2026-08-01
Source	USER-FLOWS.md
Status	Client-facing; infrastructure and source code excluded

Brand reference: bridge-ph.com/about-us/

PIMASCOR user flows

These flows implement REQUIREMENTS-V2.md. The arrows describe ownership hand-offs, like a folder moving between accountable desks.

Shipment Profitability after sign-in

Admin opens the same Approval queue as GM and can approve or return any pending financial record using explicit Administrator superuser authority. The action is recorded as Admin; the application does not impersonate the GM.

Admin God mode role operation

This is operational access rather than a read-only preview. It does not sign in as another person, reveal another password, or replace the Administrator identity in audit records.

Sign-in

The code is single-use. Its secret stays in the URL fragment, which the browser removes before verification so it is not sent in the initial Caddy/CDN request. The Requester dashboard is limited to owned shipments. A password change, account disable, or demo reset revokes affected sessions.

Shipment funding

Approval says the request is authorized; Record Payment says money actually moved. They never happen through the same button. Only the owning Requester may edit a Draft or returned request. Submission locks the record; later corrections follow the return or Additional Budget workflow.

Additional Budget

The original record is never edited to hide that more money was requested.

Liquidation

The Requester cannot edit after submission or close their own Liquidation. Mich cannot close a non-zero variance without the matching proof.

Billing

Billing does not wait for Liquidation. "Billing" remains the product term until Bridge Accounting approves formal document terminology.

Client Payments

Non-shipment Request for Payment

The actual bank is DCS's controlled choice, not part of Mich's request. Loan interest and fees default to zero and are never guessed.

DCS exception handling

Every annotation is chronological. Returning or holding never erases GM approval.

Bridge PH supervision

The monitor observes actions inside PIMASCOR, not the employee's device. Every monitor view is recorded. Passwords, email codes, keys, full bank details, keystrokes, screenshots, webcams, and unrelated personal activity are outside its scope.

Demo reset

No S3 object or database backup is read. The reset is like clearing and restocking a training showroom from a master checklist kept in the application code, including shredding the temporary documents left by the previous class.

Any signed-in role: recover from an app problem

If transaction completion is uncertain, the guidance instructs the user to check the relevant list before retrying. No form contents or confidential values enter the incident report.

Routine action results, status updates, form validation, and workflow warnings use the centered feedback dialog instead of a corner toast. They block background interaction and remain until deliberately dismissed, but do not create an incident, audit event, or email.
